Trigger - claims

Create a trigger named 'claim\_audits' on claim table that is triggered whenever a new record is inserted into claim table. This trigger will store customer name, total amount\_of\_claim by that customer with alias name 'amount\_of\_claim' and action value into the action attribute of 'claim\_audit' table. The action name in the affected log table claim\_audit is 'Updated customer claimed amount'.

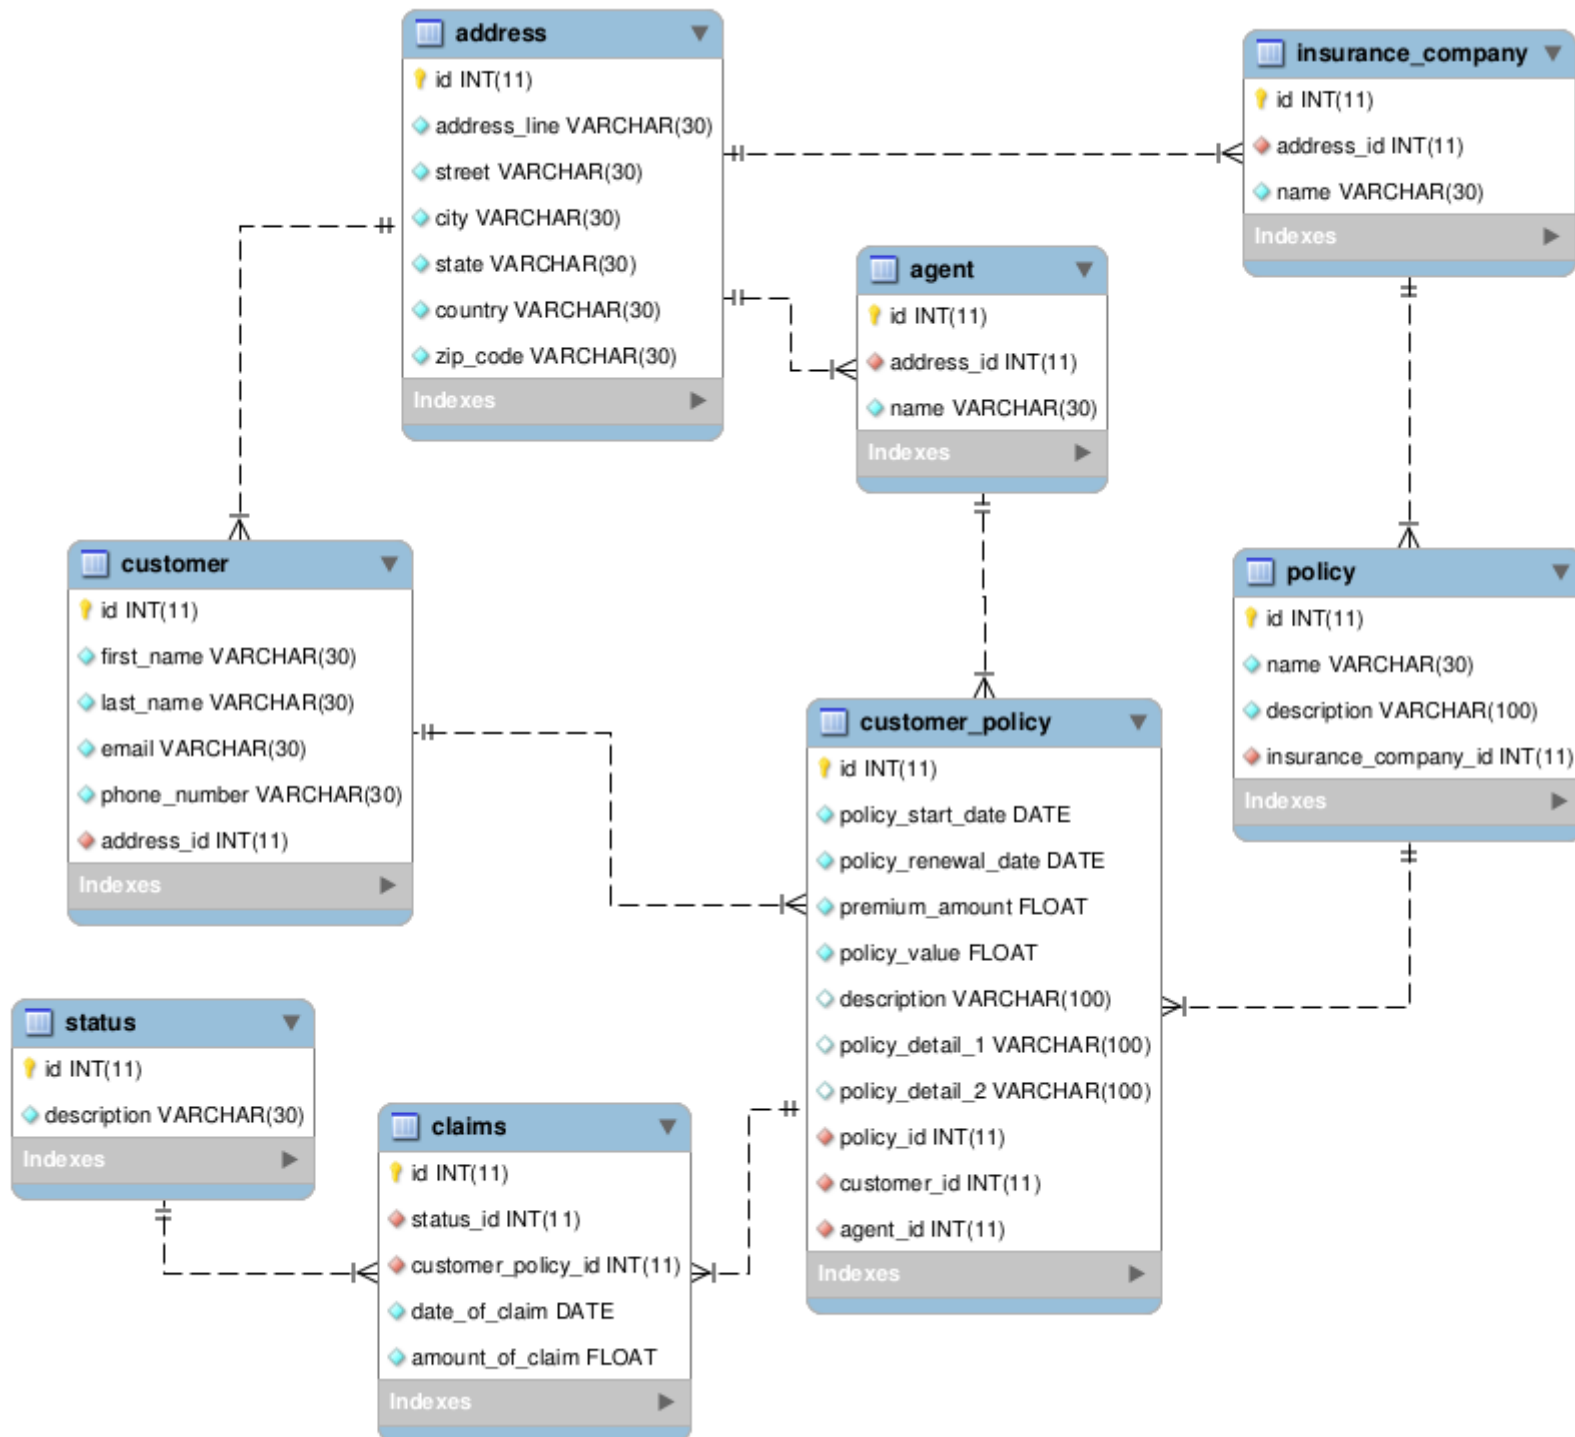

The table structure of claim\_audit table is

Column name	Data type
customer_name	Varchar(25)
amount_of_claim	Varchar(25)
action	Varchar(200)

Sample Output:

customer_name	amount_of_claim	action
abhinav	195000	Updated customer claimed amount

Hint: Data is case sensitive. Assume that the claim\_audit table has been already created

Use **GO** as the terminator, **GO** signals the end of a batch of Transact-SQL statements, in MS SQL Server.
